

# NEW METALS TECHNOLOGY I CREATIVE SILVER MODELLING

## PROJECT TWO RING WITH GEMSTONE

Measure the finger chosen for the ring using a ring gage.

---

---

---

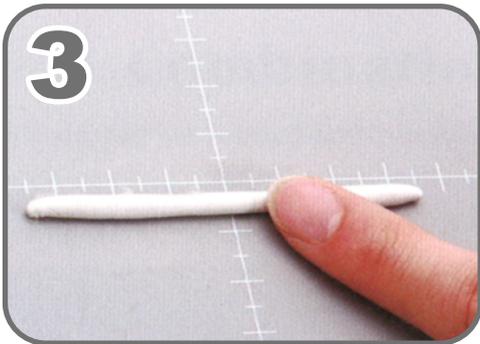

Mark where a ring 4 sizes larger fits on a wooden ring mandrel. Wrap a post'it around this point.

---

---

---

Roll the clay type into a rope shape about 8cm long. Add a small amount of water to the clay surface to avoid cracking.

---

---

---

Moisten the clay surface and place the rope end as shown, then wrap the clay rope around the mandrel.

---

---

---

**5**

Roll the top rope end into a coil.

---

---

---

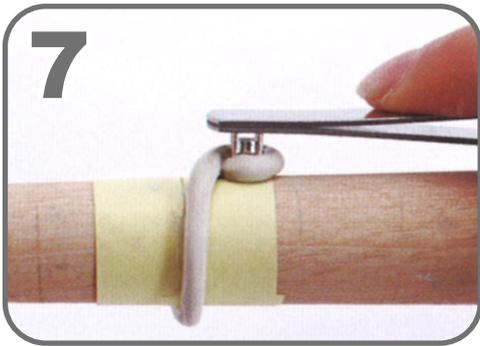

**6**

Smooth the surface and the coiled part by moistening.

---

---

---

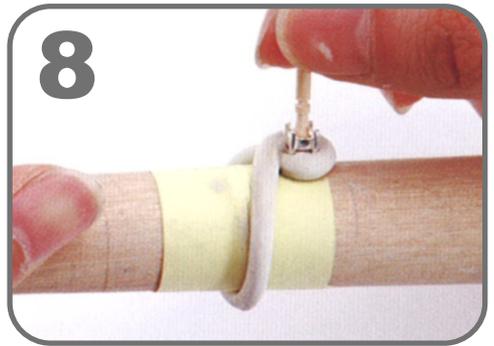

**7**

Position the silver prong head vertically into the coil.

---

---

---

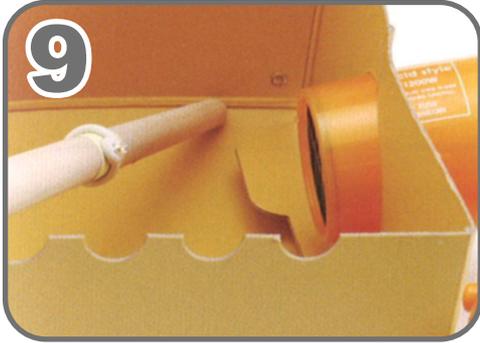

**8**

Remove any excess clay from the inside of the head.

---

---

---

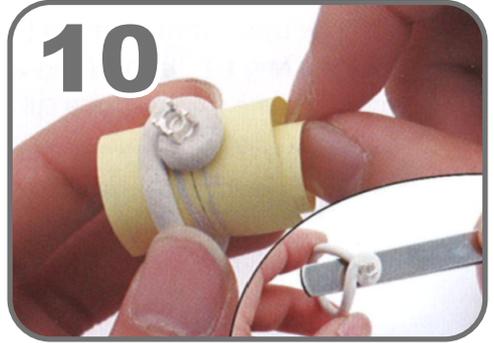

Dry the ring for at least 10 minutes.

---

---

---

Remove the ring from the mandrel and carefully remove the post-it note.

---

---

---

File to smooth the inside ring surface. DO NOT file too much or the ring size will increase!

---

---

Sand the entire surface with a sponge sanding pad (red) to pre-finish the surface.

---

---

Fire the piece at 800°C for 5 minutes.

---

---

---

Place the ring on a steel mandrel and round the shape with a nylon hammer, being careful not to hit the prongs.

---

---

---

Brush the whole surface with a stainless steel brush.

---

---

---

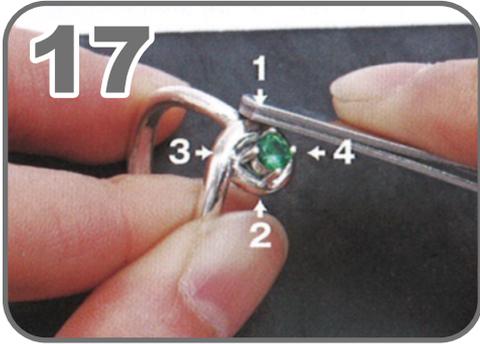

Burnish to create a smooth, shiny finish.

---

---

---

Set the stone using the end of the tweezers. Press each prong inward, starting with light pressure and repeat the process until the stone is secured firmly in position.

---

---

---

---

---

---

---

---

---

---
